(57) **ABSTRACT**

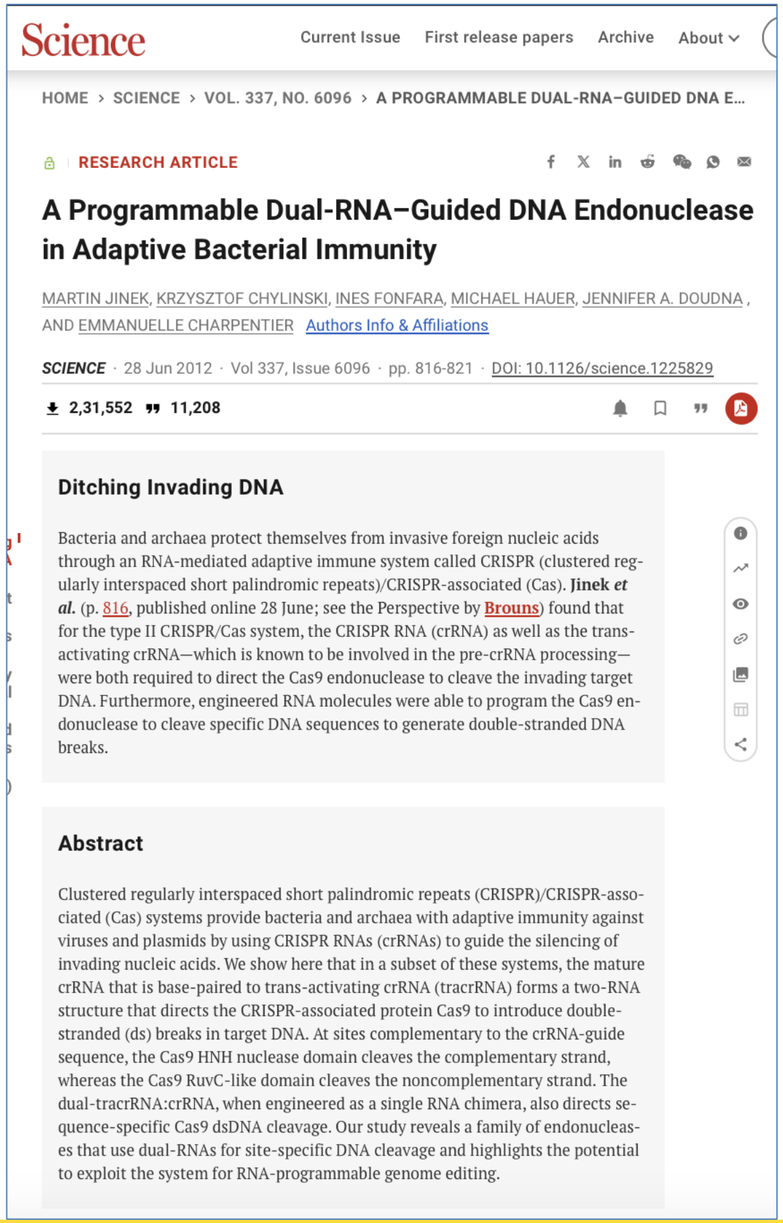

The present disclosure provides a DNA-targeting RNA that comprises a targeting sequence and, together with a modifying polypeptide, provides for site-specific modification of a target DNA and/or a polypeptide associated with the target DNA. The present disclosure further provides site-specific modifying polypeptides. The present disclosure further provides methods of site-specific modification of a target DNA and/or a polypeptide associated with the target DNA The present disclosure provides methods of modulating transcription of a target nucleic acid in a target cell, generally involving contacting the target nucleic acid with an enzymatically inactive Cas9 polypeptide and a DNA-targeting RNA. Kits and compositions for carrying out the methods are also provided. The present disclosure provides genetically modified cells that produce Cas9; and Cas9 transgenic non-human multicellular organisms.

Ditching Invading DNA

Bacteria and archaea protect themselves from invasive foreign nucleic acids through an RNA-mediated adaptive immune system called CRISPR (clustered regularly interspaced short palindromic repeats)/CRISPR-associated (Cas). **Jinek *et al.*** (p. 816, published online 28 June; see the Perspective by **Brouns**) found that for the type II CRISPR/Cas system, the CRISPR RNA (crRNA) as well as the trans-activating crRNA—which is known to be involved in the pre-crRNA processing—were both required to direct the Cas9 endonuclease to cleave the invading target DNA. Furthermore, engineered RNA molecules were able to program the Cas9 endonuclease to cleave specific DNA sequences to generate double-stranded DNA breaks.

Abstract

Clustered regularly interspaced short palindromic repeats (CRISPR)/CRISPR-associated (Cas) systems provide bacteria and archaea with adaptive immunity against viruses and plasmids by using CRISPR RNAs (crRNAs) to guide the silencing of invading nucleic acids. We show here that in a subset of these systems, the mature crRNA that is base-paired to trans-activating crRNA (tracrRNA) forms a two-RNA structure that directs the CRISPR-associated protein Cas9 to introduce double-stranded (ds) breaks in target DNA. At sites complementary to the crRNA-guide sequence, the Cas9 HNH nuclease domain cleaves the complementary strand, whereas the Cas9 RuvC-like domain cleaves the noncomplementary strand. The dual-tracrRNA:crRNA, when engineered as a single RNA chimera, also directs sequence-specific Cas9 dsDNA cleavage. Our study reveals a family of endonucleases that use dual-RNAs for site-specific DNA cleavage and highlights the potential to exploit the system for RNA-programmable genome editing.

FIGURE 4. AN INNOVATION'S MATURITY can be characterized by its technology readiness level (TRL). Research at low TRLs (1–3) is typically performed at universities and funded by grants from foundations and the federal government. Work on technologies at high TRLs (7–9) is often funded by corporations. Startups can help bridge the gap between those development levels.

The Penicillin Story

Fig 1. Photograph of the original culture plate, taken by Fleming in 1928

On 1 September 1928 Alexander Fleming became Professor of Bacteriology at St Mary's Hospital Medical School in London. He was an acknowledged expert on the staphylococcus and was following up a 1927 report by Bigger et al. describing changes in colour, texture and cohesion of Staphylococcus aureus colonies over time when left at room temperature. On 3 September 1928 he returned to London from his home in Suffolk, having been on holiday during August with his family. Before leaving for Suffolk, he had stacked all his S. aureus culture plates in one corner of his bench, out of the sun light, so that his new, young research scholar, Stuart Craddock, could work on his bench while he was away.

As Fleming started to examine his culture plates, his former assistant, Dr Merlin Pryce, walked into the laboratory and Fleming picked up the top plate, lifted the cover and said: "That's funny." Near the edge of the culture was a mould about 20 mm in diameter with a smaller satellite attached to it (Figure 1). Around it was a clear area in which organisms apparently had been lysed; further away were degenerate colonies, while still further away were normal colonies of S. aureus. Pryce looked and said: "That's how you discovered lysozyme."

Pryce left and thought nothing further of it. In February 1928 Pryce had decided to give up bacteriology and transferred to the Morbid Anatomy Department, leaving Fleming to continue the research by himself. Fortunately, this meant that he was the first person to see the penicillin effect and follow it up.

Mould contamination on culture plates had been seen by Fleming and many others before but he realised that here was something important. He subcultured the mould and kept it going in nutrient broth for further research. He found that the mould grew as a "thick, corrugated, felted mass and after a few days an intense yellow colour developed in the underlying clear fluid." He showed that after eight-days' growth at room temperature the culture fluid gave complete inhibition of staphylococci at a dilution of 1 in 500. For some months the culture fluid was known as 'mould juice' but on 7 March 1929 Fleming named the antibiotic 'penicillin'. On 10 May 1929 he submitted his first report on penicillin to the British Journal of Experimental Pathology.

The real story behind penicillin

Source: https://www.pbs.org/newshour/health/the-real-story-behind-the-worlds-first-antibiotic

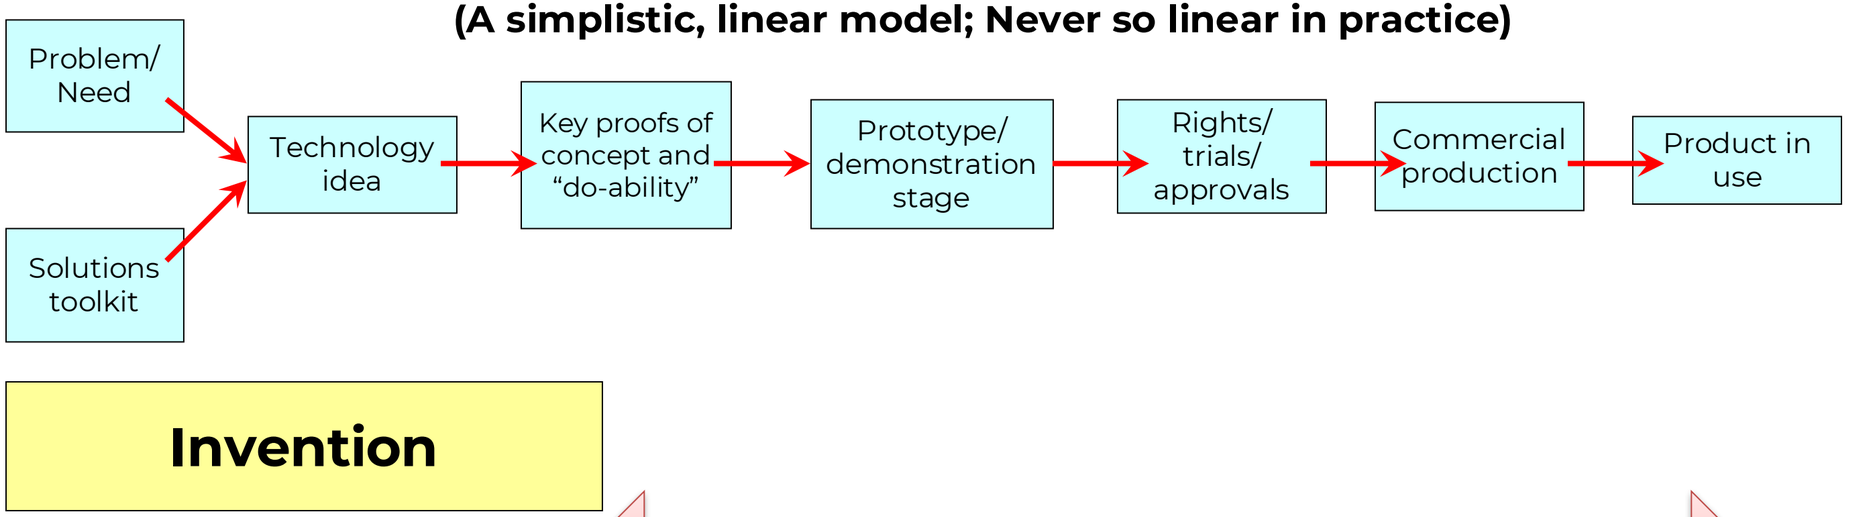

Alexander Fleming
Observation: 28 Sep 1928

- 1928: First observation by Dr Alexander Fleming, Bacteriologist
- **1938: Prof Howard Florey, Prof of Pathology; Dr Ernst Chain, Biochemist; Dr Norman Heatley, Biochemist; isolating the active ingredient of the penicillium mold juice, purifying it, figuring out which germs it was effective against, and how to use it. Producing adequate quantities for testing.**
- 1942: Anne Miller became the first civilian patient to be successfully treated with penicillin

Innovation: Taking to the market

(A simplistic, linear model; Never so linear in practice)

~ 80% of work, time, investment

Entrepreneurship – The vehicle for delivering innovations in a sustainable and scalable manner!

Note: All the inventions that are remembered have successfully navigated this process!

Technology Transfer: When it works

Problem/ Need

Solutions toolkit

→ Technology idea/ opportunity → Key proofs of concept and "do-ability" → Prototype/ demonstration stage → Rights/ trials/ approvals → Commercial production → Product in use

Ahammune

Ahammune: The Future of Autoimmune Skin Therapy

Pioneering Topical-first, Non-Steroidal Solutions for Global Skin Diseases

Who we are

A clinical-stage company developing **first-in-class** therapeutics for autoimmune skin diseases using a proprietary small molecule platform.

Our approach

A revolutionary, non-steroidal therapy designed to address the root causes of autoimmune skin conditions without the severe side effects of current standards of care.

Our Lead Asset: Topical AB1001, in human Phase 2 clinical trials in India

$50 Billion Market Vacuum

Skin Diseases: A Massive Unmet Need Plagued by Inadequate Treatments

Global Patients

1 billion+

Affected by skin diseases worldwide

Topical Dominance

>50% Market

Topical route forms majority of prescriptions

- Chronic, lifelong conditions drive **recurring drug consumption**
- Severe safety risks with current standard of care (SoC) (Many carry **FDA Boxed/Black Box warning**)
- Increasing diagnosis rates in emerging markets expand addressable population
- Growing patient awareness fueling treatment demand

Dermatology**: A large, recurring, global pharma market** with limited curative options and strong revenue visibility

Ahammune's Science: Small Molecule Therapeutics Platform

Novel trigger guards for autoimmunity & inflammation

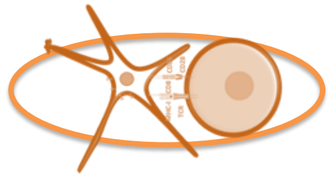

Disease modifying agents, not just symptom suppressors

PROMOTE CELLULAR HOMEOSTASIS

STIMULATE TISSUE REPAIR

ALLEVIATE IMMUNE DYSFUNCTION

MANAGE CHRONIC INFLAMMATION

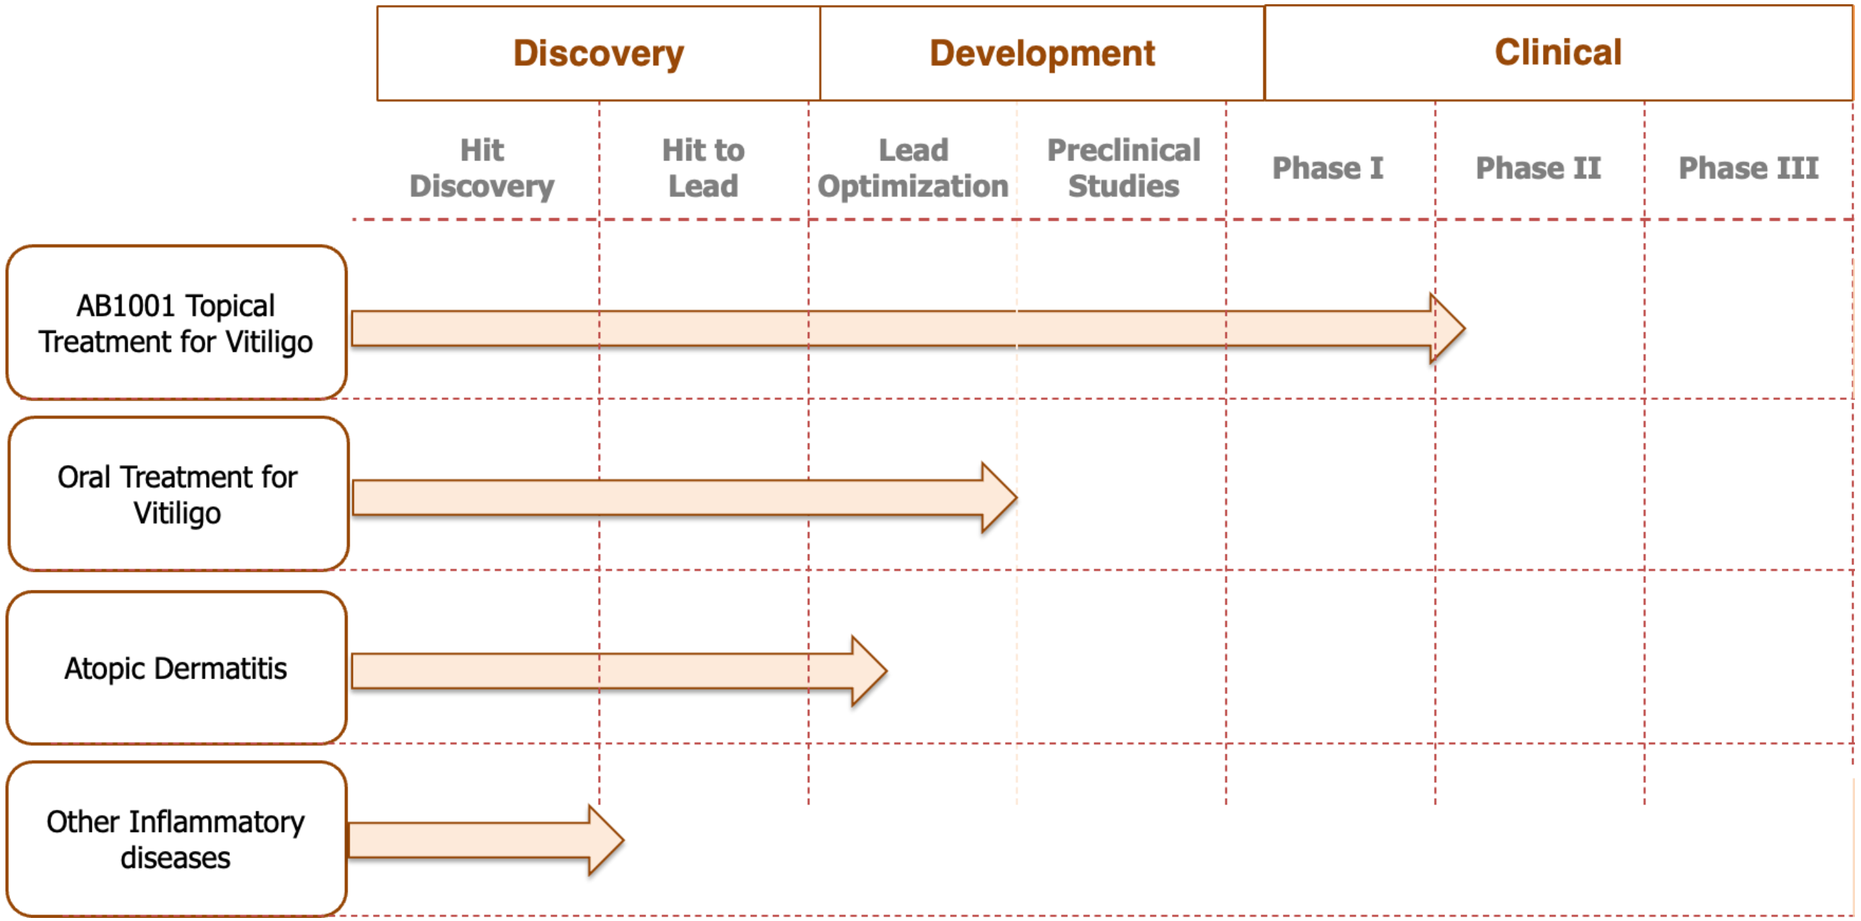

Targeting triggers for cell-specific autoimmunity

VITILIGO
Melanocytes

ATOPIC DERMATITIS
Keratinocytes

Pipeline Overview

Focused pipeline with clear partnering inflection points

Topical AB1001 as a new treatment for vitiligo

Patchy loss of skin pigmentation

The Opportunity

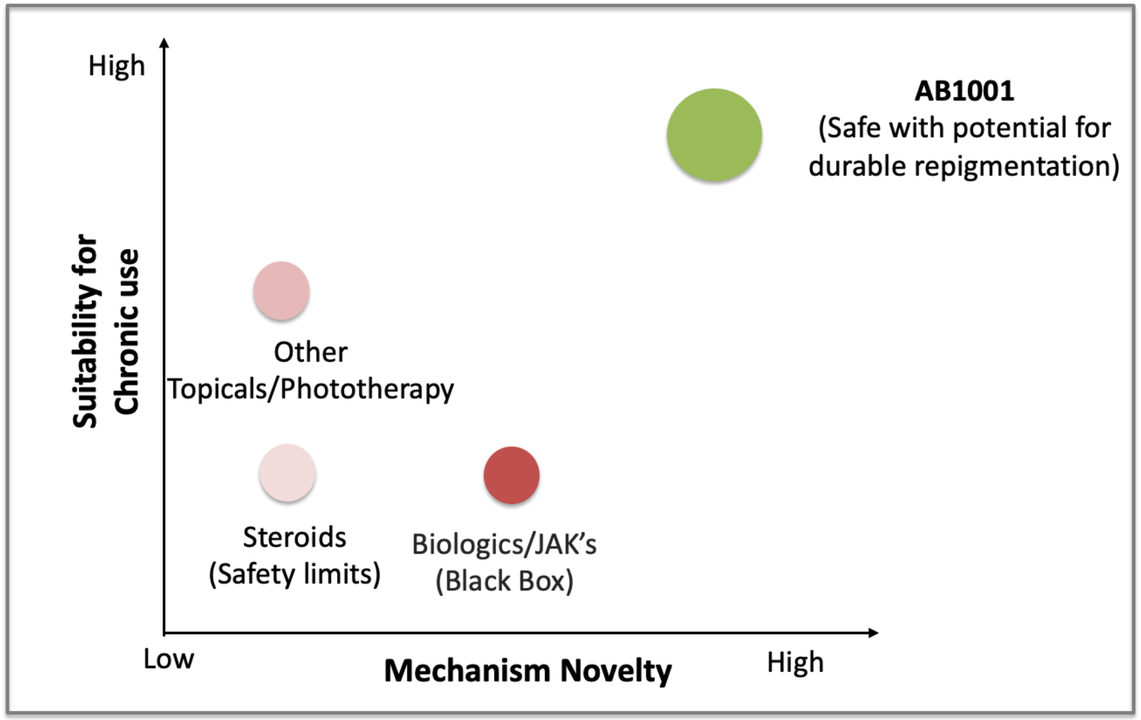

- 1-2% Global population affected
- No durable repigmentation therapy
- Boxed-warning on current treatments limits adoption
- $2B+ addressable unmet market
- Clear physician demand

Competitive Superiority and IP

First-in-class, non-steroidal durable repigmentation therapy

- ✓ A non-steroidal profile designed for long term use, a stark contrast to competitors burdened with Black Box safety warnings
- ✓ Durable pigmentation potential
- ✓ Phase 1 Human trial establishes safety
- ✓ Guaranteed intellectual property exclusivity extending through 2040+.

AB1001 Competitive Positioning: A differentiated product

Why This Matters

Differentiated from immunosuppressive drugs, suitable for chronic therapy, and possesses strong pharma partnering appeal as first-in-class asset.

Proof of Science and De-risking

AB1001 is already clinically de-risked

Preclinical Validation

Robust efficacy demonstrated in disease-relevant animal models with consistent repigmentation outcomes, derisking human studies

First-in-Class Mechanism

Novel small molecule with differentiated mechanism of action validated through multiple studies, backup molecules developed

Phase 1 Completed

Successfully completed human Phase 1 clinical trial demonstrating **safety and tolerability** in human subjects

Patents Secured

Broad geographic protection with multiple granted patents in India, USA, Europe, Japan etc

KBCols

KBCo|s sciences

NON-CONFIDENTIAL COMPANY OVERVIEW

Coloring the world in a different way

Microbial fermentation transforms biodiversity and agricultural residues into natural, scalable colour solutions.

- Founded in 2018 in Pune as a materials deep-science company
- Natural colours from microbial fermentation using agri-residue feedstocks
- First focus: textiles; platform potential across personal care, food, inks and paints

Dr Vaishali M. Kulkarni
Founder & CEO

Dr Arjun Singh Bajwa
Founder & CBO/CTO

MICROBIAL BIO-COLOUR POWDERS

From lab science

to industrial colour

KBCols sciences

Models displaying fashion collection at Lakme Fashion Week 2022. The collection is produced from the non-GMO, sustainable, natural bio-pigments developed by KBCols.

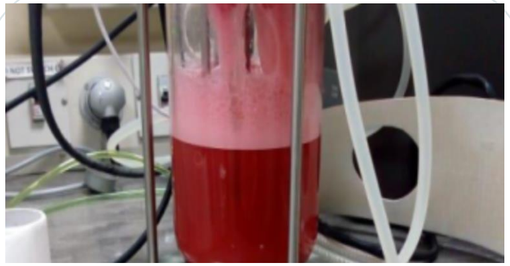

Turning biodiversity into industrial colour

A simple four-step platform: discover → ferment → formulate → apply

1 Discover

Source pigment-producing microbes from India's rich natural biodiversity.

2 Ferment

Cultivate the selected microbes using agricultural-residue feedstocks.

3 Formulate

Recover the pigment and convert it into a stable, water-soluble powder.

4 Apply

Use the bio-colour as a drop-in input in existing textile dyeing processes.

- Naturally sourced / non-GMO
- Bacteria-free final product
- Reproducible shade performance
- Applicable across multiple fibres

Lower-impact colour, built for industrial adoption

The value is not only “natural colour” — it is process performance and easier adoption

Why colour needs reinvention

Conventional synthetic dyes are largely petroleum-derived and can require high temperatures, substantial water and intensive effluent treatment.

Designed for existing textile dyeing infrastructure

Up to 40%

reduction in water usage during dyeing

22%

reduction in thermal energy

22%

reduction in electrical energy

~90%

reduction in BOD, COD and TDS effluent load

Illustrative outcomes reported in KBCols company material; results vary by shade, substrate and process.

PLATFORM APPLICATIONS

Textiles — current focus | Personal care | Food | Prints & inks | Paints

How a science-led company evolves

From a scientific thesis to a scalable colour platform — one de-risking step at a time

2018

Founding thesis

Create natural microbial colours as an alternative to petroleum-based and land-intensive colour sources.

Supported and Funded through non-dilutive Grants by BIRAC, DBT etc.

Focus on product, Team, and compliance requirements

EARLY R&D (2018-2020)

Discovery

Screen natural isolates and build the core fermentation, extraction and formulation workflow.

VALIDATION (2021-2023)

Product + application

Improve reproducibility, develop powder formats and validate shades across textile fibres and pilots with customers.

Raised Seed round through PE/VC to help company develop MVP for piloting with mills and customers;

Product iterations begin from customer feedback

Raised pre-series A round for **scaling up production, operations and team**

Scale + commercial start (2024-2025)

product certifications, commission a demonstration plant and complete the first commercial order/export

2026+

Platform expansion

Scale textile commercialization while advancing personal care, food, inks and paints.

Transitioning to full commercialization stage

Series A ongoing

DEEP-TECH LESSON

Scientific proof → repeatability → product fit → manufacturability → market adoption

Backed by a strong innovation ecosystem

Venture investors, public biotechnology support and angel investors have helped KBCols move from lab science to industrial validation

BACKED / SUPPORTED BY

Chiratae Ventures

NABVENTURES

Axilor Ventures

BIRAC

AWE Funds

DERBI Foundation

Other angel investors

Capital, mentoring and network support for science-led scale-up

Support across the journey: venture capital, biotechnology grants / programs, incubation and angel backing.

Checklist & lessons

Checklist

- Problems: New problem. New insight in an old problem. Current solution to problem unsatisfactory.
- Solutions: New implementation. New tools.
- Invention: Connecting the “problem space” and “solution space” in new ways
- Product realization: Design, prototyping, testing, validation
- POC → Proof of value; Unique value proposition
- Innovation: Market introduction of invention
- Technology licensing: Champions within the licensee
- Venturing and startups: New entities advancing inventions
- Startup founders
- Ecosystems: Funding, incubators, others

© Venture Center, 2026

Lessons

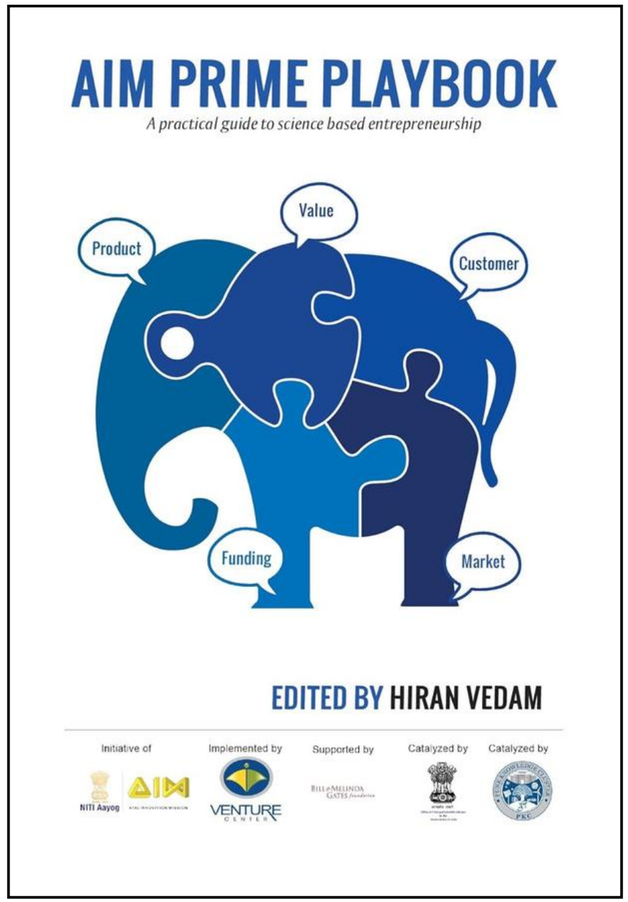

- Spend more time in need identification & problem definition
- “Connecting the dots” is key to inventing
- Stay abreast of the “dots”; Look out for problems, new tools. Read widely.
- In the startup world, foresight is important! (& future is uncertain!) Cultivate foresight. Build comfort with uncertainty and risk.
- Think about path to commercialization early.
- Customers want solutions and not technologies/ inventions. Be ready to do whatever is needed to provide the solution.
- Focus on unique value propositions as opposed to features
- Do not underestimate the importance of “technology commercialization champions” (full-time founders in the startup world). Investors bet on entrepreneurs and not innovators.
